

### **Stage 2 Burn Ban Now in Effect**

*Where alternative sources of heat are available, the use of fireplaces and wood stoves and pellet stoves is prohibited until air quality improves.*

**VANCOUVER, Wash.** – The Southwest Clean Air Agency (SWCAA) is issuing a Stage 2 Burn Ban in all of Clark County due to continued high levels of fine particulate pollution. This means that where alternative sources of heat exist, the use of all fireplaces, pellet stoves, wood stoves and inserts is prohibited until air quality improves and the Stage 2 Burn Ban is lifted. This Ban will extend through Tuesday, January 20<sup>th</sup>, but may be lifted earlier if pollution levels begin to decrease. If wood burning is your sole source of heat, you are exempt from this curtailment and we ask that you burn as clean as possible. All outdoor burning is also prohibited during this Stage 2 Burn Ban.

“We are hopeful that these measures will be enough to keep us from reaching dangerously high levels of fine particle pollution,” said Bob Elliott, executive director of the agency. “Whether it is achieved through driving less or reducing wood smoke, we need to see some demonstrated improvement in our air quality. We are not asking anyone to go without heat, but to use an alternative source of heat if possible until our air quality improves.”

On cold nights with little or no wind, wood smoke pollution can accumulate to levels that are considered unhealthy. Fine particles released by smoke from wood stoves, fireplaces and other burning are of concern because they can reach deep into the lungs. Episodes of high fine particle pollution can trigger asthma attacks, cause difficulty breathing and make lung and heart problems worse.

(more)

In years past, the Southwest Clean Air Agency (SWCAA) has asked southwest Washington residents to *voluntarily* limit wood burning during Air Pollution Advisories. However, recent revisions to Washington state law now require that when levels of fine particle pollution are forecasted to reach unhealthy levels, SWCAA must notify Washington residents to curtail wood burning activities and use an alternative source of heat if they have one. These *mandatory*, temporary wood burning curtailments exempt residents whose only source of heat is burning wood.

The Oregon Department of Environmental Quality (DEQ), as in years past, will continue to ask Oregon residents to voluntarily limit their wood burning by issuing Air Pollution Advisories when fine particulate pollution is expected to rise to unhealthy levels.

“Our respective agencies share the same ‘airshed’ and the same concerns about wood smoke and public health,” says DEQ spokesperson William Knight. “We’ll continue to monitor the quality of our air and we’ll continue to let people know when pollution reaches unsafe levels. Though we do not have the authority at this time to ban woodstove use during a pollution event, our air advisories will urge Oregonians to follow southwest Washington’s example.”

These curtailments occur in two progressive stages as needed:

**Stage 1:** The use of all fireplaces and uncertified wood stoves and inserts is banned when pollution is forecasted to reach unhealthy levels. Uncertified units are typically older than 1990 and lack a certification label on the back of the unit.

**Stage 2:** All wood heating is prohibited, including certified units, when the Stage 1 curtailment has not reversed the increasing pollution trend and weather conditions still indicate a high risk for exceeding air quality health standards.

These curtailments will not apply to homes with no other source of adequate heat. All outdoor burning is also banned during these burn bans. If the air quality forecast is exceptionally bad and air pollution levels are expected to rise very rapidly, SWCAA may need to call a Stage 2 curtailment without first calling a Stage 1.

To sign up to receive e-mail notifications of these wood stove curtailment burn bans, visit [www.swcleanair.org](http://www.swcleanair.org). To receive Air Pollution Advisories from Oregon DEQ, visit [www.deq.state.or.us/aq/advisories](http://www.deq.state.or.us/aq/advisories).

### **Tips for Cleaner Burning:**

The most complete and effective way to reduce wood smoke pollution is to use another form of heat. If you must use wood, or choose to do so when local rules permit, the following recommendations can help diminish the emissions from your wood stove, fireplace or fireplace insert:

- Only burn dry, seasoned wood. Be sure your firewood has been split and dried for at least one year.
- Never burn wet, painted, stained or treated wood, color newsprint, plastic, garbage, diapers or magazines. Items such as these produce high amounts of odor, smoke and toxic fumes. Burning these materials is illegal and also an excellent way to start a chimney fire.
- Store your firewood under cover. A shed or shelter is best. If you use a plastic tarp, allow ventilation to prevent condensation.
- Burn small, hot fires. This helps the wood burn completely and cleanly.
- Never allow the fire to smolder. Smoldering fires are the worst polluters because they burn at a temperature too low for efficient combustion. The result is more smoke—unburned wood going up the chimney, wasted.
- Do not damper too much. Allow enough air for the wood to burn fully, without smoldering. Never try to keep the fire going overnight by cutting back the air supply. This wastes wood, produces much smoke and creosote and produces little heat.
- Step outside and look at the plume from your chimney. You should see only heat waves. If you can see smoke, your wood is not burning completely. Increase the air supply to your fire.
- Size your wood stove properly. A stove that is too large for the space to be heated will have to be damped down, causing much smoke and wasting wood.

- Do not burn in moderate temperatures. Your stove will tend to overheat your house. You will want to close the dampers to cut back on the heat, which cuts oxygen to the fire, wastes wood and increases pollution.
- Don't install a wood stove until you have considered other ways to cut heating costs. Insulating and weather stripping can cost less than a stove and will reduce your heating requirements, whether your heat sources is wood, oil, gas or electricity.
- Don't install an uncertified stove—installation of uncertified stoves is illegal. These stoves are more polluting.

Founded in 1968, the mission of the Southwest Clean Air Agency is to preserve and enhance the air quality in southwest Washington. Serving the counties of Clark, Cowlitz, Lewis, Skamania and Wahkiakum, SWCAA is responsible for protecting the public's health through the enforcement of federal, state and local air quality standards and regulations.
